

## A spectral sequence for Iwasawa adjoints

Uwe Jannsen, 1994 and July 29, 2003

Let  $k$  be a number field, fix a prime  $p$ , and let  $k_\infty$  be some Galois extension of  $k$  such that  $\mathcal{G} = \text{Gal}(k_\infty/k)$  is a  $p$ -adic Lie-group (e.g.,  $\mathcal{G} \cong \mathbb{Z}_p^r$  for some  $r \geq 1$ ). Let  $S$  be a finite set of primes containing all primes above  $p$  and  $\infty$ , and all primes ramified in  $k_\infty/k$ , and let  $k_S$  be the maximal  $S$ -ramified extension of  $k$ ; by assumption,  $k_\infty \subseteq k_S$ . Let  $G_S = \text{Gal}(k_S/k)$  and  $G_{\infty,S} = \text{Gal}(k_S/k_\infty)$ .

Let  $A$  be a discrete  $G_S$ -module which is isomorphic to  $(\mathbb{Q}_p/\mathbb{Z}_p)^r$  for some  $r \geq 1$  as an abelian group (e.g.,  $A = \mathbb{Q}_p/\mathbb{Z}_p$  with trivial action, or  $A = E[p^\infty]$ , the group of  $p$ -power torsion points of an elliptic curve  $E/k$  with good reduction outside  $S$ ). We are **not** assuming that  $G_{\infty,S}$  acts trivially.

Let  $\Lambda = \mathbb{Z}_p[[\mathcal{G}]]$  be the completed group ring. For a finitely generated  $\Lambda$ -module  $M$  we put

$$E^i(M) = \text{Ext}_\Lambda^i(M, \Lambda).$$

Hence  $E^0(M) = \text{Hom}_\Lambda(M, \Lambda) =: M^+$  is just the  $\Lambda$ -dual of  $M$ . This has a natural structure of a  $\Lambda$ -module, by letting  $\sigma \in \mathcal{G}$  act via

$$\sigma f(m) = \sigma f(\sigma^{-1}m)$$

for  $f \in M^+$ ,  $m \in M$ . It is known that  $\Lambda$  is a noetherian ring (here we use that  $\mathcal{G}$  is a  $p$ -adic Lie group), by results of Lazard [La]. Hence  $M^+$  is a finitely generated  $\Lambda$ -module again (choose a projection  $\Lambda^r \twoheadrightarrow M$ ; then we have an injection  $M^+ \hookrightarrow (\Lambda^r)^+ = \Lambda^r$ ). By standard homological algebra, the  $E^i(M)$  are finitely generated  $\Lambda$ -modules for all  $i \geq 0$  which we call the (generalized) Iwasawa adjoints of  $M$ .

### Examples

- a) If  $\mathcal{G} = \mathbb{Z}_p$ , then  $\Lambda = \mathbb{Z}_p[[\mathcal{G}]] \cong \mathbb{Z}_p[[X]]$  is the classical Iwasawa algebra, and, for a  $\Lambda$ -torsion module  $M$ ,  $E^1(M)$  is isomorphic to the Iwasawa adjoint, which can be defined as

$$\text{ad}(M) = \varprojlim_n (M/\alpha_n M)^\vee$$

where  $(\alpha_n)_{n \in \mathbb{N}}$  is a sequence of elements in  $\Lambda$  such that  $\lim_{n \rightarrow \infty} \alpha_n = 0$  and  $(\alpha_n)$  is prime to the support of  $M$  for every  $n \geq 1$ , and where

$$N^\vee = \text{Hom}(N, \mathbb{Q}_p/\mathbb{Z}_p)$$

is the Pontrjagin dual of a compact  $\mathbb{Z}_p$ -module  $N$ . For any finitely generated  $\Lambda$ -module  $M$ ,  $E^1(M)$  is quasi-isomorphic to  $\text{Tor}_\Lambda(M)^\sim$ , where  $\text{Tor}_\Lambda(M)$  is the  $\Lambda$ -torsion submodule of  $M$ , and  $M^\sim$  is the "Iwasawa twist" of a  $\Lambda$ -module  $M$ : the action of  $\gamma \in \mathcal{G}$  is changed to the action of  $\gamma^{-1}$ .

- b) If  $\mathcal{G} = \mathbb{Z}_p^r$ ,  $r \geq 1$ , then the  $E^i(M)$  are the standard groups considered in local duality. By duality for the ring  $\mathbb{Z}_p[[\mathcal{G}]] = \mathbb{Z}_p[[x_1, \dots, x_r]]$ , they can be computed in terms of local cohomology groups (with support) or by a suitable Koszul complex.

The topic of this note is the following observation.

**Theorem 1** *There is a spectral sequence of finitely generated  $\Lambda$ -modules*

$$E_2^{p,q} = E^p(H^q(G_{\infty,S}, A)^\vee) \Rightarrow \varprojlim_{k',m} H^{p+q}(G_S(k'), A[p^m]) = \varprojlim_{k'} H^{p+q}(G_S(k'), T_p A).$$

Here the limit runs through the natural numbers  $m$  and the finite extensions  $k'/k$  contained in  $k_\infty$ , respectively, via the natural maps  $H^n(G_S(k'), A[p^{m+1}]) \rightarrow H^n(G_S(k'), A[p^m])$  and the corestrictions. The rightmost group is the continuous cohomology of the Tate module  $T_p A = \varprojlim_m A[p^m]$ .

Before we give the proof of a slightly more general result (cf. Theorem 11 below), we discuss what this spectral sequence gives in more down-to-earth terms. First of all, we always have the 5-low-terms exact sequence

$$\begin{aligned} 0 &\rightarrow E^1(H^0(G_{\infty,S}, A)^\vee) \xrightarrow{\text{inf}^1} \varprojlim_{k'} H^1(G_S(k'), T_p A) \\ &\rightarrow (H^1(G_{\infty,S}, A)^\vee)^+ \longrightarrow E^2(H^0(G_{\infty,S}, A)^\vee) \xrightarrow{\text{inf}^2} \varprojlim_{k'} H^2(G_S(k'), T_p A). \end{aligned}$$

To say more, we consider some assumptions.

**A.1** Assume that  $p > 2$  or that  $k_\infty$  is totally imaginary. Then

$$H^r(G_{\infty,S}, A) = 0 = \varprojlim_{k'} H^r(G_S(k'), T_p A)$$

for all  $r > 2$ .

**Corollary 2** *Assume that  $H^2(G_{\infty,S}, A) = 0$  (This is the so-called "weak Leopoldt conjecture" for  $A$ . It is stated classically for  $A = \mathbb{Q}_p/\mathbb{Z}_p$ , and there are precise conjectures when this is expected for representations coming from algebraic geometry, cf. [Ja 2]).*

Then the cokernel of  $\text{inf}^2$  is

$$\ker(E^1(H^1(G_{\infty,S}, A)^\vee) \rightarrow E^3(H^0(G_{\infty,S}, A)^\vee)),$$

and there are isomorphisms

$$E^i(H^1(G_{\infty,S}, A)^\vee) \xrightarrow{\sim} E^{i+2}(H^0(G_{\infty,S}, A)^\vee)$$

for  $i \geq 2$ .

**Proof** This comes from A.1 and the following picture of the spectral sequence

**Corollary 3** Assume that  $H^0(G_{\infty, S}, A) = 0$ . Then

(a)

$$\varinjlim_{k'} H^1(G_S(k'), T_p A) \xrightarrow{\sim} H^1(G_{\infty, S}, A)^\vee{}^+$$

(b) There is an exact sequence

$$\begin{aligned} 0 \rightarrow E^1(H^1(G_{\infty, S}, A)^\vee) &\rightarrow \varinjlim_{k'} H^2(G_S(k'), T_p A) \\ &\rightarrow (H^2(G_{\infty, S}, A)^\vee)^+ \rightarrow E^2(H^1(G_{\infty, S}, A)^\vee) \rightarrow 0 \end{aligned}$$

(c) There are isomorphisms

$$E^i(H^2(G_{\infty, S}, A)^\vee) \xrightarrow{\sim} E^{i+2}(H^1(G_{\infty, S}, A)^\vee)$$

for  $i \geq 1$ .

**Proof** In this case, the spectral sequence looks like

**Corollary 4** Assume that  $\mathcal{G}$  is a  $p$ -adic Lie group of dimension 1 (equivalently: an open subgroup is  $\cong \mathbb{Z}_p$ ). Then  $E^i(-) = 0$  for  $i \geq 3$ . Let

$$B = \text{im} (\text{inf}^2 : E^2(H^0(G_{\infty,S}, A)^\vee) \rightarrow \varprojlim_{k'} H^2(G_S(k'), T_p A))$$

Then  $B$  is finite, and there is an exact sequence

$$\begin{aligned} 0 \rightarrow E^1(H^1(G_{\infty,S}, A)^\vee) &\rightarrow \varprojlim_{k'} H^2(G_S(k'), T_p A)/B \rightarrow (H^2(G_{\infty,S}, A)^\vee)^+ \\ &\rightarrow E^2(H^1(G_{\infty,S}, A)^\vee) \rightarrow 0, \end{aligned}$$

and

$$E^1(H^2(G_{\infty,S}, A)^\vee) = 0 = E^2(H^2(G_{\infty,S}, A)^\vee),$$

i.e.,  $(H^2(G_{\infty,S}, A)^\vee)$  is a projective  $\Lambda$ -module.

**Proof** Quite generally, for a  $p$ -adic Lie group  $\mathcal{G}$  of dimension  $n$  one has  $\text{vcd}_p(\mathcal{G}) = n$  for the virtual cohomological  $p$ -dimension of  $\mathcal{G}$ , and hence  $E^i(-) = 0$  for  $i > n + 1$ , cf. [Ja 3]. The finiteness of  $E^2(M)$  (for a finitely generated  $\Lambda$ -module  $M$ ) in our case is well-known, cf. [Ja 3]. The remaining claims follow from the following shape of the spectral sequence:

**Lemma 5** Assume that  $\mathcal{G}$  is a  $p$ -adic Lie group of dimension  $n$  (e.g.,  $\mathcal{G}$  contains an open subgroup  $\cong \mathbb{Z}_p^n$ ). Then  $E^i(H^0(G_{\infty,S}, A)^\vee) = 0$  for  $i \neq n, n + 1$ .

(a) If  $H^0(G_{\infty,S}, A)$  is divisible (e.g., if  $G_{\infty,S}$  acts trivially on  $A$ ), then

$$E^i(H^0(G_{\infty,S}, A)^\vee) = \begin{cases} 0 & \text{for } i \neq n \\ \text{Hom}(D, H^0(G_{\infty,S}, A)), & \text{for } i = n, \end{cases}$$

where  $D$  is the dualising module for  $\mathcal{G}$  ( $D = \mathbb{Q}_p/\mathbb{Z}_p$  if  $\mathcal{G} = \mathbb{Z}_p^n$ ).

(b) If  $H^0(G_{\infty,S}, A)$  is finite, then

$$E^i(H^0(G_{\infty,S}, A)^\vee) = \begin{cases} 0 & \text{for } i \neq n + 1 \\ \text{Hom}(H^0(G_{\infty,S}, A), D)^\vee & \text{for } i = n + 1 \end{cases}$$

an isomorphism

$$E^1(H^2(G_{\infty,S}, A)^\vee) \xrightarrow{\sim} E^3(H^1(G_{\infty,S}, A)^\vee),$$

and the vanishing

$$E^2(H^2(G_{\infty,S}, A)^\vee) = 0 = E^3(H^2(G_{\infty,S}, A)^\vee).$$

**Proof** The spectral sequence looks like

$$\begin{array}{cccc}
 & \uparrow & & & \\
 2 & \times & \times & \times & \times \\
 1 & \times & \times & \times & \times \\
 & \downarrow & & & \\
 & 0 & 0 & 0 & \times \\
 & & 1 & 2 & 3
 \end{array}$$

**Remark** In the situation of Corollary 5, one has an exact sequence up to *finite modules*:

$$\begin{aligned}
 0 &\rightarrow E^1(H^1(G_{\infty,S}, A)^\vee) \rightarrow \varprojlim_{k'} H^2(G_S(k'), T_p A) \\
 &\rightarrow (H^2(G_{\infty,S}, A)^\vee)^+ \rightarrow E^2(H^1(G_{\infty,S}, A)^\vee) \rightarrow 0.
 \end{aligned}$$

**Corollary 8** Let  $\mathcal{G}$  be a  $p$ -adic Lie group of dimension  $> 2$ . Then

$$(H^1(G_{\infty,S}, A)^\vee)^+ \cong \varprojlim_{k'} H^1(G_S(k'), T_p A)$$

**Proof** The first three columns of the spectral sequence look like

$$\begin{array}{ccc}
 & \uparrow & \\
 2 & \times & \times \quad \times \\
 1 & \times & \times \quad \times \\
 & \downarrow & \\
 & 0 & 0 \quad 0 \\
 & & 1 \quad 2
 \end{array}$$

We will now prove Theorem 1, by proving a somewhat more general result. For any profinite group  $G$ , let  $\Lambda(G) = \mathbb{Z}_p[[G]]$  be the completed group ring over  $\mathbb{Z}_p$ , and let  $M_G = M_{G,p}$  be the category of discrete (left)  $\Lambda(G)$ -modules. These are the discrete  $G$ -modules  $A$  which are  $p$ -primary torsion abelian groups. For such a module  $A$ , its Pontrjagin dual  $A^\vee = \text{Hom}(A, \mathbb{Q}_p/\mathbb{Z}_p)$  is a compact  $\Lambda(G)$ -module. In fact, Pontrjagin duality gives an anti-equivalence between  $M_G$  and the category  $C_G = C_{G,p}$  of compact (right)  $\Lambda(G)$ -modules.

Let  $M_G^{\mathbb{N}}$  be the category of inverse systems

$$(A_n) : \dots \rightarrow A_3 \rightarrow A_2 \rightarrow A_1$$

in  $M_G$  as in [Ja 1]. Denote by  $H_{\text{cont}}^i(G, (A_n))$  the continuous cohomology of such a system and recall that one has an exact sequence for each  $i$

$$0 \rightarrow \varprojlim_n^1 H^{i-1}(G, A_n) \rightarrow H_{\text{cont}}^i(G, (A_n)) \rightarrow \varprojlim_n H^i(G, A_n) \rightarrow 0,$$

in which the  $\lim^1$ -term vanishes if the groups  $H^{i-1}(G, A_n)$  are finite for all  $n$  (cf. loc. cit.).

**Definition 9** For a closed subgroup  $H \leq G$  and a discrete  $G$ -module  $A$  in  $M_G$  define the relative cohomology  $H^m(G, H; A)$  as the value at  $A$  of the  $m$ -th derived functor of the left exact functor (with  $\text{Ab}$  being the category of abelian groups)

$$\begin{aligned} H^0(G, H; -) : M_G &\rightarrow \text{Ab} \\ A &\mapsto \varprojlim_U H^0(U, A), \end{aligned}$$

where  $U$  runs through all open subgroups  $U \subset G$  containing  $H$ , and the transition maps are the corestriction maps. For an inverse system  $(A_n)$  of modules in  $M_G$  define the continuous relative cohomology  $H_{\text{cont}}^m(G, H; (A_n))$  as the value at  $(A_n)$  of the  $m$ -th right derivative of the functor

$$\begin{aligned} H_{\text{cont}}^0(G, H; -) : M_G^{\mathbb{N}} &\rightarrow \text{Ab} \\ (A_n) &\mapsto \varprojlim_n \varprojlim_U H^0(U, A_n), \end{aligned}$$

where the limit over  $U$  is as before, and the limit over  $n$  is induced by the transition maps  $A_{n+1} \rightarrow A_n$ .

**Lemma 10** If  $G/H$  has a countable basis of neighbourhoods of identity, i.e., if there is a countable family  $U_\nu$  of open subgroup,  $H \leq U_\nu \leq G$ , with  $\bigcap_\nu U_\nu = H$ , and if, in addition,  $H^i(U, A_n)$  is finite for all these  $U$  and all  $n$ , then

$$H_{\text{cont}}^n(G, H; (A_n)) = \varprojlim_n \varprojlim_U H^n(U, A_n).$$

**Proof** In general, by deriving the inverse limit  $\varprojlim_{n,U}$ , one gets a Grothendieck spectral sequence

$$E_2^{p,q} = R^p \varprojlim_{n,U} H^q(U, A_n) \Rightarrow H_{\text{cont}}^{p+q}(G, H; (A_n)).$$

If the limit is over a countable family, then  $R^p \varprojlim_{n,U} = 0$  for  $p > 1$ , and  $R^1 \varprojlim_{n,U}$  has the usual description ([Ja 1]). If, in addition, all  $H^q(U, A_n)$  are finite, then  $R^1 \varprojlim_{n,U} H^q(U, A_n) = 0$ , and we get the claimed isomorphisms.

Now we come to the spectral sequence in theorem 1. Any module  $A$  in  $M_G$  gives rise to two inverse systems, viz., the system  $(A[p^n])$ , where the transition maps  $A[p^{n+1}] \rightarrow A[p^n]$  are induced by multiplication with  $p$  in  $A$ , and the system  $(A/p^n)$ , where the transition maps are induced by the identity of  $A$ . For reasons explained later, denote by  $H_{\text{cont}}^m(G, H; RT_p A)$  the value at  $A$  of the  $m$ -th derived functor of the left exact functor

$$F : A \rightsquigarrow \varprojlim_n \varprojlim_U H^0(U, A[p^n])$$

where  $U$  runs through all open subgroups  $U \subset G$  containing  $H$ , and the transition maps are the corestriction maps and those coming from  $A[p^{n+1}] \rightarrow A[p^n]$ , respectively. If  $H$  is a normal subgroup, then we may restrict to normal open subgroups  $U \leq G$  containing  $H$  in the above inverse limit, and the limit is a (left)  $\Lambda(G/H)$ -module in a natural way.

**Theorem 11** *Let  $H$  be a closed subgroup of a profinite group  $G$ , and let  $A$  be a discrete  $\Lambda(G)$ -module.*

(a) *There are short exact sequences*

$$0 \rightarrow H_{\text{cont}}^n(G, H; (A[p^n])) \rightarrow H_{\text{cont}}^n(G, H; RT_p A) \rightarrow H_{\text{cont}}^{n-1}(G, H; (A/p^n)) \rightarrow 0.$$

*If  $H$  is a normal subgroup, then these are exact sequences of  $\Lambda(G/H)$ -modules.*

(b) *Let  $H'$  be a normal subgroup of  $G$ , with  $H' \subset H$ . There is a spectral sequence*

$$E_2^{p,q} = H_{\text{cont}}^p(G/H', H/H'; RT_p H^q(H', A)) \Rightarrow H_{\text{cont}}^{p+q}(G, H; RT_p A).$$

*If  $H$  is a normal subgroup, too, this is a spectral sequence of  $\Lambda(G/H)$ -modules.*

(c) *If  $H$  is a normal subgroup of  $G$ , then for every discrete  $\Lambda(G)$ -module  $A$  one has canonical isomorphisms of  $\Lambda(G/H)$ -modules*

$$H^m(G, H; RT_p A) \cong \text{Ext}_{\Lambda(G)}^m(A^\vee, \Lambda(G/H))$$

*for all  $m \geq 0$ , where  $\Lambda(G/H)$  is regarded as a  $\Lambda(G)$ -module via the ring homomorphism  $\Lambda(G) \rightarrow \Lambda(G/H)$ . More precisely, the  $\delta$ -functor*

$$M_G \rightarrow \text{Mod}_{\Lambda(G/H)} \quad , \quad A \rightsquigarrow (H^m(G, H; RT_p A) \mid m \geq 0)$$

*is canonically isomorphic to the  $\delta$ -functor*

$$M_G \rightarrow \text{Mod}_{\Lambda(G/H)} \quad , \quad A \rightsquigarrow (\text{Ext}_{\Lambda(G)}^m(A^\vee, \Lambda(G/H)) \mid m \geq 0).$$

*Here and in the following, the Ext-groups  $\text{Ext}_{\Lambda(G)}(-, -)$  are taken in the category  $C_G$  of compact  $\Lambda(G)$ -modules. We note that these Ext-groups are  $\Lambda(G)$ -modules, but not necessarily compact.*

(d) In particular, let  $H$  be a normal subgroup of  $G$ , and let  $\mathcal{G} = G/H$ . If  $A$  is a discrete  $\Lambda(G)$ -module, then one has a spectral sequence of  $\Lambda(\mathcal{G})$ -modules

$$E_2^{p,q} = \text{Ext}_{\Lambda(\mathcal{G})}^p(H^q(H, A)^\vee, \Lambda(\mathcal{G})) \Rightarrow H_{\text{cont}}^{p+q}(G, H; R\underline{T}_p A) = \text{Ext}_{\Lambda(G)}^{p+q}(A^\vee, \Lambda(\mathcal{G})).$$

Before we give the proof of Theorem 11, we note that it implies Theorem 1. In fact, we apply Theorem 11 to  $G = G_S$  and  $H = G_{\infty,S}$ . If  $A$  is a  $G_S$ -module of cofinite type as in Theorem 1, then  $A/p^n = 0$  and  $A[p^n]$  is finite, for all  $n$ . Moreover,  $H^i(U, B)$  is known to be finite for all open subgroups  $U \leq G_S$  and all finite  $U$ -modules  $B$ . By (a) and Lemma 10 we deduce

$$H_{\text{cont}}^m(G_S, G_{\infty,S}; RT_p A) = \varprojlim_{n,U} H^m(U, A[p^n]) = \varprojlim_{n,k'} H^m(G_S(k'), A[p^n]),$$

where  $k'$  runs through all finite subextensions of  $k_\infty/k$ . Moreover, one has canonical isomorphisms

$$\varprojlim_n H^m(U, A[p^n]) \cong H^m(U, T_p A)$$

where the latter group is continuous cochain group cohomology, cf. [Ja 1]. By applying Theorem 11 (d) we thus get the desired spectral sequence. Finally,  $H^m(H, A)^\vee$  is a finitely generated  $\Lambda(\mathcal{G})$ -module for all  $m \geq 0$ , so that the initial terms of the spectral sequence are finitely generated  $\Lambda(\mathcal{G})$ -modules as well, and so are the limit terms. In fact, let  $N$  be the kernel of the homomorphism  $G_S \rightarrow \text{Aut}(A)$  given by the action of  $G_S$  on  $A$ , and let  $H' = H \cap N$ . Then  $G/H'$  is a  $p$ -adic analytic Lie group, since  $G/H$  and  $G/N$  are. It is well-known that  $H^m(H', \mathbb{Q}_p/\mathbb{Z}_p)$  is a cofinitely generated discrete  $\Lambda(G/H')$ -module for all  $m \geq 0$ ; hence the same is true for  $H^m(H', A) \cong H^m(H', \mathbb{Q}_p/\mathbb{Z}_p) \otimes T_p A$ . The claim then follows from the Hochschild-Serre spectral sequence  $H^p(H/H', H^q(H', A)) \Rightarrow H^{p+q}(H, A)$ .

**Proof of Theorem 11 (a):** We can write  $F$  as the composition of the two left exact functors

$$\begin{array}{ccc} \underline{T}_p : M_G & \rightarrow & M_G^{\mathbb{N}} \\ & & A \rightsquigarrow (A[p^n]) \end{array}$$

and

$$\begin{array}{ccc} H_{\text{cont}}^0(G, H; -) : M_G^{\mathbb{N}} & \rightarrow & \text{Ab} \\ & & (A_n) \rightsquigarrow \varprojlim_n \varprojlim_U H^0(U, A_n), \end{array}$$

where  $U$  runs through all open (normal) subgroups of  $G$  containing  $H$ . Because  $\underline{T}_p$  maps injectives to  $H_{\text{cont}}^0(G, H; -)$ -acyclics we get a spectral sequence

$$E_2^{p,q} = H_{\text{cont}}^p(G, H; R^q \underline{T}_p A) \Rightarrow H_{\text{cont}}^{p+q}(G, H; R\underline{T}_p A).$$

From the snake lemma one immediately gets

$$R^q \underline{T}_p A = \begin{cases} (A/p^m A) & q = 1 \\ 0 & q > 1 \end{cases}$$

and hence short exact sequences

$$0 \rightarrow H_{\text{cont}}^n(G, H; \underline{T}_p A) \rightarrow H_{\text{cont}}^n(G, H; R\underline{T}_p A) \rightarrow H_{\text{cont}}^{n-1}(G, H; R^1 \underline{T}_p A) \rightarrow 0.$$

This shows (a) and also explains the notation for  $R^n F$ . In fact,  $H_{\text{cont}}^n(G, H; RT_p A)$  is the hypercohomology with respect to  $H_{\text{cont}}^0(G, H; -)$  of a complex  $RT_p A$  in  $M_G^{\mathbb{N}}$  computing the  $R^i T_p A$ .

(b): If  $H$  is a normal subgroup, we can regard the functor  $F$  as a functor from  $M_G$  to the category  $\text{Mod}_{\Lambda(G/H)}$  of  $\Lambda(G/H)$ -modules. On the other hand, we can also write  $F$  as the composition of the left exact functors

$$H^0(H, -) : M_G \rightarrow M_{G/H} \quad , \quad A \rightsquigarrow A^H$$

and

$$\tilde{F} : M_{G/H} \rightarrow \text{Mod}_{\Lambda(G/H)} \quad , \quad B \rightsquigarrow \varprojlim_n \varprojlim_{U/H} H^0(U/H, B[p^n]) = H^0(G/H, \{1\}; RT_p B).$$

(Note that  $U/H$  runs through all open (normal) subgroups of  $G/H$ .) This immediately gives the spectral sequence in (b).

(c): We claim that the functor  $F$  is isomorphic to the functor

$$\begin{aligned} M_G &\rightarrow \text{Mod}_{\Lambda(G/H)} \\ B &\rightsquigarrow \text{Hom}_{\Lambda(G)}(B^\vee, \Lambda(G/H)). \end{aligned}$$

In fact, writing  $\text{Hom}_{\Lambda(G)}(-, -)$  for the homomorphism groups of compact  $\Lambda(G)$ -modules, we have (cf. [Ja 3] p. 179)

$$\begin{aligned} \text{Hom}_{\Lambda(G)}(B^\vee, \Lambda(G/H)) &= \varprojlim_U \text{Hom}_{\Lambda(G)}(B^\vee, \mathbb{Z}_p[G/U]) \\ &= \varprojlim_n \varprojlim_U \text{Hom}_{\text{cont}}(H^0(U, B)^\vee, \mathbb{Z}/p^n \mathbb{Z}) \\ &= \varprojlim_n \varprojlim_U \text{Hom}_{\text{cont}}(H^0(U, B[p^n])^\vee, \mathbb{Z}/p^n \mathbb{Z}) \\ &= \varprojlim_n \varprojlim_U H^0(U, B[p^n]), \end{aligned}$$

where  $U$  runs through all open subgroups of  $G$  containing  $H$ , and hence

$$\text{Hom}_{\Lambda(G)}(B^\vee, \Lambda(G/H)) = H^0(G, H; RT_p B).$$

Since taking Pontrjagin duals is an exact functor  $M_G \rightarrow C_G$  taking injectives to projectives, the derived functors of the functor  $B \rightsquigarrow \text{Hom}_{\Lambda(G)}(B^\vee, \Lambda(G/H))$  are the functors  $B \rightsquigarrow \text{Ext}_{\Lambda(G)}^i(B^\vee, \Lambda(G/H))$ , and we get (c). Finally, by applying (b) for  $H' = H$  and (c) for  $H = \{1\}$  we get (d).

Let us note that the proof of theorem 11 gives the following  $\mathbb{Z}/p^n$ -analogue (by 'omitting the inverse limits over  $n$ '). For a profinite group  $G$  let  $\Lambda_n(G) = \Lambda(G)/p^n = \mathbb{Z}/p^n[[G]]$  be the completed group ring over  $\mathbb{Z}/p^n$ .

**Theorem 12** *Let  $H$  and  $H'$  be normal subgroups of a profinite group  $G$ , with  $H' \subset H$ , and let  $A$  be a discrete  $\Lambda_n(G)$ -module.*

(a) *There is a spectral sequence of  $\Lambda_n(G/H)$ -modules*

$$E_2^{p,q} = H^p(G/H', H/H'; H^q(H', A)) \Rightarrow H^{p+q}(G, H; A).$$

(b) On the category of discrete  $\Lambda_n(G)$ -modules the  $\delta$ -functor  $A \rightsquigarrow (H^m(G, H; A) \mid m \geq 0)$  with values in the category of  $\Lambda_n(G/H)$ -modules is canonically isomorphic to the  $\delta$ -functor  $A \rightsquigarrow (Ext_{\Lambda_n(G)}^m(A^\vee, \Lambda_n(G/H)) \mid m \geq 0)$ , where the Ext-groups are taken in the category of compact  $\Lambda_n(G)$ -modules.

(c) In particular, if  $\mathcal{G} = G/H$ , and  $A$  is a discrete  $\Lambda_n(G)$ -module, then one has a spectral sequence of  $\Lambda_n(\mathcal{G})$ -modules

$$E_2^{p,q} = Ext_{\Lambda_n(\mathcal{G})}^p(H^q(H, A)^\vee, \Lambda_n(\mathcal{G})) \Rightarrow H^{p+q}(G, H; A) = Ext_{\Lambda_n(G)}^{p+q}(A^\vee, \Lambda(G)).$$

**Corollary 13** With the notations as for Theorem 1, let  $A$  be a finite  $\Lambda_n(G_S)$ -module, and  $\Lambda_n = \Lambda(\mathcal{G})$ . Then there is a spectral sequence of finitely generated  $\Lambda_n$ -modules

$$E_2^{p,q} = Ext_{\Lambda_n}^p(H^q(G_{\infty,S}, A)^\vee, \Lambda_n) \Rightarrow \varprojlim_{k'} H^{p+q}(G_S(k'), A) = Ext_{\Lambda_n(G_S)}^{p+q}(A^\vee, \Lambda_n),$$

where  $k'$  runs through the finite subextensions  $k'/k$  of  $k_\infty/k$ .

On the other hand, Theorem 1 also has the following counterpart for finite modules.

**Theorem 14** With notations as for Theorem 1, let  $A$  be a finite  $p$ -primary  $G_S$ -module, of exponent  $p^n$ . Then there is a spectral sequence

$$E_2^{p,q} = Ext_{\Lambda}^p(H^q(G_{\infty,S}, A)^\vee, \Lambda) \Rightarrow \varprojlim_{k'} H^{p+q-1}(G_S(k'), A) = Ext_{\Lambda_n(G_S)}^{p+q-1}(A^\vee, \Lambda_n),$$

where, in the inverse limit,  $k'$  runs through the finite extension  $k'$  of  $k$  inside  $k_\infty$  and the transition maps are the corestrictions.

**Proof** As in the proof of Theorem 1, Theorem 11 (d) applies to  $G = G_S$  and  $H = G_{\infty,S}$ . But now the inverse system  $(A[p^n])$  is Mittag-Leffler-zero in the sense of [Ja 1]: if the exponent of  $A$  is  $p^d$ , then the transition maps  $A[p^{n+d}] \rightarrow A[p^n]$  are zero. This implies that  $H_{cont}^m(G_S, (A[p^n])) = 0$  for all  $m \geq 0$ , cf. [Ja 1]. On the other hand it is clear that the system  $(A/p^n)$  is essentially constant ( $A/p^n = A$  for  $n \geq d$ ). From Theorem 11 (a) and Lemma 10 we immediately get

$$H_{cont}^m(G_S, G_{\infty,S}; RT_p A) \cong H_{cont}^{m-1}(G_S, G_{\infty,S}; (A/p^n)) \cong \varprojlim_{k'} H^{p+q-1}(G_S(k'), A),$$

and hence the claim, by applying Theorem 12 (b) in addition.
